

Start a new orchard with drip using our BIG filter with a mesh clean and an auto or manual cleaner in it; AVC or MVC.

Then, 2 or 3 years later when the trees are big enough you switch out the mesh screen and head for a fine perf screen (using mini sprinklers now).

The mesh or perf fit into the same filter body. There are also manual or automatic cleaners for each screen type.

Advantages:

- *Extra sales for you
- *Appreciable cost savings for the grower compared to other systems.
